

Chiefs Touchless Cleaning Methods  
*Solutions for every washing operation*

# Touchless Cleaning Methods – Solutions

The concept of touchless cleaning relies on a number of key elements. At Chiefs we break this concept down into four main categories.

## Foam Lance (ST-73)

This system is the entry level application, uses the least amount of hardware yet still gives an excellent result. It requires a minimal budget and is simple to setup. Ideal for operations with a small fleet and domestic users.

Thousands of these units are in use around Australia.

Water -> Pressure cleaner -> Foam lance with cleaning agent -> air = foam

## Single Downstream Injector (ST-160)

This system has the advantage of drawing from a larger reservoir of a single cleaning agent, with more precision than the foam lance. It allows the operator to choose from a wide range of water and foam lances, or a twin rolover lance for even greater efficiency. Typically used for small to medium fleets, earthmoving and farm operations and fleet hire businesses.

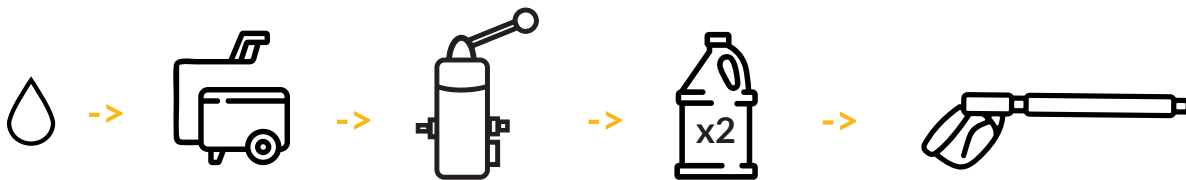

Water -> Pressure Cleaner -> Downstream Injector -> Cleaning Agent -> Foam Lance and a High-Pressure Water lance/Rollover Lance

# Options for every washing operation

ements. High pressure water, a suitable cleaning agent and air.  
main categories to suit a variety of operations.

## Twin Downstream Injector (ST-164)

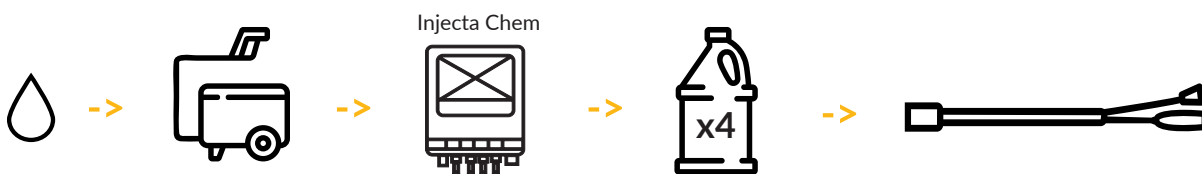

The twin injector system adds another level of convenience to an industrial cleaning operation, bringing greater efficiency and capacity. It allows for not only two cleaning agents to be accessed, but also a high-pressure water bypass option. This system is very convenient when using complimentary chemicals in a two-step process or when perhaps a cleaning agent and a degreaser are both required to achieve the required results. Heavy haulage, mining and any medium sized industrial operation would enjoy the benefits of this system.

Water -> Pressure Cleaner -> Twin Downstream Injector -> Cleaning Agents x 2-> Foam Lance and a High-Pressure Water lance/Rollover Lance

## Injecta Chem – 4-way injector valve

The Chiefs inspired Injecta Chem adds value and efficiency to any wash bay operation. Having the ability to run any one of up to four separate chemicals via a downstream injector at the turn of a simple selector, makes for a wash facility like no other. Already installed in a number of wash bays throughout Australia, the Injecta Chem provides for a wider range of chemical products to suit the multiple needs to the cleaning facility.

Water -> Pressure Cleaner -> Injecta Chem -> Cleaning Agents x 4, -> Foam Lance and a High-Pressure Water lance/Rollover Lance
